## Lakeview Pharmacy Now Offers Compounded Tadalafil Troches for Erectile Dysfunction.

### What is a Troche?

A troche is a small lozenge that dissolves between the gum and cheek. The medication is directly absorbed through the mucus membrane of the mouth. This delivery method helps to avoid the medication going through the digestive process. Troches are carefully prepared in our compounding pharmacy to meet specific patient needs.

### How to Take a Troche?

Place troche in mouth and gently push the troche as deep as it will go between the gum and cheek. Do not swallow or chew the troche. It usually takes between 15-30 minutes for the troche to dissolve. Tadalafil can last up to 36 hours.
